Language 1B: Imaginative writing

How to start

- something odd
  → mystery
  → questions for reader
- plunge / in - media res
- language that surprises
- question
- contrast (normal / abnormal)
- direct speech
- simple, short sentences
- start with ending
- bold controversial statement

The waves lapped up silently against the coarse, hardened sand. The skies were dark, an eerie, foreboding tinge of grey which stretched from horizon to horizon, further sullied by a churn of pollutants. Gases which suck away human life, were constantly ejected into the upper atmosphere. It had been 5 years since the last fish, the last lifeform, was seen in these oceans; the only reminders of the old world were the carcasses of creatures which once sailed and thrived in the seas.

— good to see ya have gone back + put a few in.

taken over by climate change, ecological catastrophies, and perilous famine. The good old days where you could visit new cities, watch a hockey match or even light a simple campfire, are now nothing more than a bad dream. No longer could can you relax on a beach in Abu Dhabi, watching a fiery red ball of fire dip below the never ending horizon. The times where one could gaze out over New York, or (in a heavenly way) glide over the Himalayan mountain range, existedonly in photos, and our long faded minds, caught in a fearsome death grip between good and evil, happiness and disaster, nature and humanity. You see, our downfall was not mere fate. It was not the natural passage of time and evolution. In a word, it was us. The one species ~~we tovingly~~ that took everything for granted, had been brought to the brink of extinction by a creation which proved, quite wholeheartedly, to be nothing but relentless destruction. All those climate agreements, those UN summits, those NASA press conferences about the "Safety and welfare of our planet" were pacifiers to our kind, fake news reports that aired day after day, week after week, year after year. People began to realise that the truth was not being disclosed; the real extinction of ~~[illegible]~~ mankind had already begun. From the day we burnt our first fossil fuels, endless clouds of thick, bleak smog smothered the stratosphere, and we didn't realise our bigger problems. We never considered, not even for a second, the catalysm that was due to hit our planet. Those great philosophers and scientists were right after all, but not one person ever took their wise forebodings into consideration. Hawking's speech in 2017 regarding how our planet would become a "burning fireball" by 2600 due to a phenomenon called "the accelerated greenhouse effect" was at the time considered a hoax, one of the many predictions circulating on the internet. But what fools we were, passing off the countless theories, shoving them

This is a lovely piece of extended writing Aryan - well done. You create some great rhythms in your sentences using verbs + your vocab is mature.

NB: In an exam you'd need a bit more narrative but we will look at this.

out of our lives ~~as~~ as if they were loose bits of paperwork. Everything was discarded. Every warning, every influential environmentalist, all the "large scale" conservationists were simply thrown away, their works and attempts to preserve the planet gone. And still, even after their last-ditch attempts, we carried on. By 2020, 3 billion people worldwide, from Europe to Africa, Asia to Australia, Russia to the Middle East, had lost their homes, their lives, their families due to rising sea levels. The world's great cities, London, Paris, Mumbai and even places like Bangkok and Tokyo had been inundated, their shops, restaurants and landmarks giving way to the rising seas, our new global ocean. Whilst masses of water engulfed coastal regions globally, desertification took hold, turning large swathes of Southern Africa, India and low lying islands into desert, along with all of Eastern China. Seas around the world were receding, being drawn back into the very crevices of the Earth. Slowly but surely, the flooding came to a painful halt, entire oceans receding into the depths. From the International Space Station, it seemed as if the continents were re-appearing, rising up again after being lost to the deep. They were only missing one thing. Humans. The vast majority of our species had been scourged away, pulled to the seabed, much like our ancestors had millions of years previously prior. They, however, had it easy. Their own creations, their marvels did not turn on them, (very much) unlike us, who thought we could harness energy at no expense. And as that malevolent, rather ironic reality dawns upon me now, looking out at the windswept sky, a single tear streams down my cheek, before hopelessly dissapating into the scorching midnight. My last, vile yet bitter thought hangs in my head, a burning one to which we ~~would never have~~, and never will never have any answer to.

Why didn't we change our fate?

** → italics
